New Approach to Control Use Of Narcotics Slated in California

By RICHARD RICHARDS
State Senator

A new approach to narcotics control will be launched in the Los Angeles area next month, as a result of legislation enacted at the 1959 regular session.

The basic design of the new program is to prevent the re-addiction of known narcotics addicts and thus to control the market on which the illicit drug trade thrives.

Under the present plan, two field groups of especially trained and experienced personnel will be established, each supervising 200 former addicts released on parole from State prisons.

IF THE pilot program proves effective, it has been suggested that all known heroin addicts could be placed under such close supervision that it would be impossible for them to revert to the use of narcotics to any substantial extent. The purpose of the pilot project is to demonstrate that treatment on parole is fully as effective and far less expensive than the return of the addict to prison for long confinement. The probable cost of the pilot program will be about \$170,000 per year.

It is estimated by experienced parole agents that about one-half of all paroled addicts revert to the use of drugs during the first year after release. If 200, or half, of this first experimental group were returned to prison for the current average of 18 months, the cost to the taxpayers would be around \$600,000.

If this could be reduced to 10 per cent, the prison cost would be reduced accordingly, for a possible saving of around \$300,000 a year. Potential savings would be even greater if the experimental program is extended to the whole addict population, as it almost certainly will be if the pilot project shows the expected results.

Governor Brown has hailed the program as California's best new hope for coping with the narcotics menace, and it is being watched with interest by narcotics specialists everywhere.

THESE PAROLEES will be given intensive supervision and counseling, along with frequent naline tests to detect any return to the use of narcotics.

If it is found that narcotics use has been resumed, it will thus be detected quickly and the parolee immediately confined to the unit's treatment center at the California Institute for Men in Chino.

After medical and psychological treatment for up to 90 days, it is expected that the parolee in most cases would be returned to the community on an out-patient basis under strict supervision. If this treatment does not prove adequate, he will be returned to prison.

An intensive 160-hour training course for supervising personnel was begun on Sept. 1, in preparation for handling this new approach to the narcotics problem. Parole agents

Hay Fever Allergy Disorder Affects Millions in Nation

By ROY O. GILBERT, M.D.
County Health Officer

Hay fever, which is not caused by hay and is not accompanied by a fever, is an allergy disorder that afflicts millions of people in the United States. It is a condition that is caused by a hypersensitivity to specific substances, which may range from certain foods to air-borne pollens. Whatever the cause, hay fever makes its victims extremely miserable.

The disorder is sometimes broken down into two major types, seasonal and perennial (non-seasonal). Seasonal hay fever is by far the most common type and occurs during the periods of the year when the various trees, plants and grasses that cause it are in bloom.

PERENNIAL HAY fever occurs at any time and may be due to house dust, animal hair, feathers, cosmetics, infections within the body, any number of foods, or a host of other things. Individuals with this condition are particularly unfortunate, as there is no season at all when they are free of the possibility of an attack.

Unmistakable symptoms accompany a bad hay fever attack. The eyes redden and water; the nose is stuffed up; the throat, roof of the mouth, and the eyes and nose all burn and itch. Violent sneezing often makes the victim exhausted.

Not all persons suffer so severely. In some cases, the malady may be so mild that it is taken for a recurrent summer cold. But as the years go on, chances are that the condition will get worse unless checked.

Drugs offer rapid and immediate relief during an attack but none now in use, including the antihistamines, will prevent the condition from recurring.

Avoidance of the irritants is the simplest and best treatment of all. The thing to do in the seasonal type, according to one writer, is to remove the patient from the pollens or the pollens from the patient. In either type, however, is it always possible to remove the offending allergen and, in that case, hay fever "shots" are necessary.

These injections consist of an extract made from those substances which, through many medical tests, have been found sufficiently irritating to the patient to cause an attack. When given over a period of time, an immunity is built up and the individual may go several years before the hay fever recurs.

MEDICAL RESEARCHERS now claim that it will not be long before a "one shot" desensitizer for any one allergy will be available, and this will certainly be a boon to those persons who find the "repeated shot" treatment of allergies both expensive and time-consuming.

Some parts of the country have less pollen than others. The wooded areas of northern Minnesota, Michigan, New Hampshire and Maine, the southern tip of Florida and the Pacific Coast are the best places for hay fever victims, according to reports, while the Midwest and plains states show the heaviest pollen counts.

Most allergy specialists caution against moving permanently to what is thought to be ragweed-free areas and suggest periods of trial residence before the final change is made. Many persons come to California from ragweed-prevalent areas only to encounter different irritants to which they are sensitive.

However, most hay fever sufferers do not expect a Utopia completely free of respiratory irritants. All they are searching for is a little relief.

A pamphlet giving additional information on hay fever will be mailed to anyone who sends a card of request to the Division of Health Education, Los Angeles County Health Dept., 241 N. Figueroa St., Los Angeles 12.

Presbyterian Registration Dates Slated

Church School registration and parent orientation of the First Presbyterian Church of Gardena, 1957 Redondo Beach Blvd., will be held tonight at 7:30 in the Fellowship Hall. Two further meetings will be held, Sunday afternoon at 4 and Tuesday evening, Sept. 22, at 7:30. The Board of Christian Education policy requires that all children from 3 years through grade six be registered by their parents each year. Junior and senior high students may register themselves but their parents are invited to attend one of these meetings to become acquainted with the teachers and materials.

Dr. R. Murray Jones has chosen "Is Your God Too Small?" as his sermon topic for Sunday, Sept. 20. Worship service is held at 11 a.m. each Sunday. Church School begins at 9:20 a.m. and is held at the old church, 1842 Gardena Blvd. Nursery care is provided for both.
